Introduction

Purpose

Use this section to

- get contact information for laboratories;
- determine which tests are available and the tests’ turnaround times; and
- identify which laboratory can perform a specific test.

The diagnosis of tuberculosis (TB), management of patients with the disease, and public health TB control services rely on accurate laboratory tests. Laboratory services are an essential component of effective TB control, providing key information to clinicians (for patient care) and public health agencies (for control services).¹

Policy

Public health laboratories should ensure that clinicians and public health agencies within their jurisdictions have ready access to reliable laboratory tests for diagnosis and treatment of TB.²

Effective TB control requires timely, complete, and accurate communication among the laboratory system, TB control program, and healthcare provider.³

For roles and responsibilities, refer to the “Roles, Responsibilities, and Contact Information” topic in the Introduction.
Laboratory Contact Information

To locate and contact a laboratory, refer to Table 1: **Laboratory Contact Information**. For the list of the tests performed at each laboratory, refer to Table 2: **Available Laboratory Tests**.

**TABLE 1: LABORATORY CONTACT INFORMATION**

<table>

| **State Laboratory**       | **Montana Public Health Laboratory**  
| Full-service mycobacteriology laboratory. Accepts primary specimens and referral isolates for identification and susceptibility testing of *Mycobacterium tuberculosis*. Serves as a consultant for questions involving mycobacterium laboratory testing. | Susanne Zanto, CLS (NCA), SM (NRM)  
Laboratory Manager  
Microbiology and Molecular Diagnostics  
Street address: 1400 Broadway, Helena, MT 59620  
Mailing address: P.O. Box 6489, Helena, MT 59604  
Tel: 800-821-7284 and 406-444-3444  
Fax: 406-444-1802  
Email: szanto@mt.gov |
| **Private Laboratories**   | **St. Patrick Hospital**  
Provide primary specimen smear and culture for mycobacterium. Refer isolates for identification and susceptibility testing. | Dennis Grasseschi  
Microbiology Supervisor  
P.O. Box 4587, Missoula, MT 59806  
Tel: 406-543-7271 ext 2207  
Fax: 406-329-5676  
Email: dgrasses@saintpatrick.org |
| **Benefis Healthcare**     | **St. Vincent’s Healthcare**  
Rich Luoma  
Microbiology Supervisor  
1101 26th Street South, Great Falls, MT 59405  
Tel: 406-455-5445  
Fax: 406-455-4970  
Email: luomricl@benefis.org | Lowell Temme  
Microbiology Supervisor  
1233 North 30th Street, Billings, MT 59101  
P.O. Box 35200, Billings, MT 59107  
Tel: 406-237-8000  
Fax: 406-237-8098  
Email: lowell.temme@svh-mt.org |
Available Laboratory Tests

The laboratory tests listed below in Table 2 are available where noted.

When performing tests for the diagnosis of mycobacterial infection, both acid-fast bacilli smear and culture must be ordered. Culture identification is automatically performed on any isolate, and first-line susceptibility testing is automatically performed on all initial *Mycobacterium tuberculosis* complex isolates. Nucleic acid amplification testing is ordered on an individual basis.

Laboratories should report positive smears or positive cultures, and primary healthcare providers should report suspected or confirmed cases of TB to the health department, as specified in the “Reporting Tuberculosis” topic in the Surveillance section. Prompt reporting allows the health department to organize treatment and case management services and to initiate a contact investigation as quickly as possible.  

For information on reporting, see the “Reporting Tuberculosis” topic in the Surveillance section.

For laboratory services available in Montana, contact Susanne Zanto, Laboratory Manager, Microbiology and Molecular Diagnostics, at the Montana Public Health Laboratory at 800-821-7284 or 406-444-3444.
Specimen Collection

For an explanation of proper specimen collection and submission, see the online version of the MTPHL Laboratory Services Manual at http://www.dphhs.mt.gov/PHSD/Lab/Clinical/pdf/clinical-lab-manual2006.pdf.

Sputum is phlegm from deep in the lungs. The important characteristics needed in sputum specimens are freshness and actual sputum, rather than saliva. An early morning specimen is best, so when collecting a set of three sputum specimens, at least one of them should be an early morning specimen.

To isolate mycobacteria from clinical materials successfully, handle specimens carefully after collection. For optimal results, collect specimens in clean, sterile containers and keep them in conditions that inhibit the growth of contaminating organisms, since most specimens will contain bacteria other than mycobacteria.

Refer to Table 3 to review the methods used to collect various specimens and the type of specimens obtained for pulmonary tuberculosis (TB).

During procedures in which aerosols may be produced, use appropriate respiratory protection and environmental controls. For more information, refer to the CDC’s “Guidelines for Preventing the Transmission of Mycobacterium tuberculosis in Health-care Settings, 2005” (MMWR 2005;54[No. RR-17]) at http://www.cdc.gov/mmwr/pdf/rr/rr5417.pdf.
### TABLE 3: SPECIMEN COLLECTION METHODS AND TYPES
FOR PULMONARY TUBERCULOSIS

<table>
<thead>
<tr>
<th>Pulmonary Tuberculosis</th>
<th>Specimen Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Collection Method</strong></td>
<td><strong>Specimen Type</strong></td>
</tr>
<tr>
<td><strong>Spontaneous sputum collection</strong> occurs when the patient can cough up sputum without extra assistance.</td>
<td>5–10 ml of sputum from deep in the lung</td>
</tr>
<tr>
<td><strong>Induced sputum collection</strong> should be considered if a patient needs assistance in bringing up sputum.*</td>
<td>5–10 ml of sputum from deep in the lung</td>
</tr>
<tr>
<td><strong>Gastric aspirates</strong> can be submitted for the diagnosis of pulmonary tuberculosis (TB) in young children who cannot produce sputum.</td>
<td>50 ml of gastric contents</td>
</tr>
</tbody>
</table>
| **Bronchoscopy** can be used in the following situations:  
  - If a patient cannot produce sputum by the above three methods* or  
  - If a patient has a substantial risk of drug-resistant TB and has initial routine studies that are negative* or  
  - In a patient in whom there is suspicion of endobronchial TB* or  
  - If a variety of clinical specimens for the diagnosis of pulmonary TB or other possible diseases need to be obtained |  
  - Bronchial washings  
  - Bronchoalveolar lavage  
  - Transbronchial biopsy |

* It is important to specify if the sputum is induced or not, because induced sputum is “more watery” and appears to be just saliva. Some laboratories may throw out induced sputum and report it as an inadequate specimen.
Refer to Table 4 for collection methods and specimen types for extrapulmonary TB.

**TABLE 4: SPECIMEN COLLECTION METHODS AND TYPES FOR EXTRAPULMONARY TUBERCULOSIS**

* Do not place specimens in formalin.

**How to Perform Spontaneous Sputum Collection at a Healthcare Facility**

1. Collect the specimen in a specialized room or booth designed for cough-inducing procedures.

2. Instruct the patient on how to collect the sputum sample.
   a. Put a mark at the 5 ml level on the sputum tube (if not already marked) to show the patient the minimum amount of sputum needed. (Most laboratories consider 5 to 10 ml an adequate amount.)
   b. Review with the patient how to collect sputum.

3. Make sure the specimen container and laboratory requisition are filled out completely before shipping.
   a. On the specimen container, record the patient name and the date and time of collection.
   b. Use the blue “Montana Standard Laboratory Requisition” form.

   ! It is especially important to specify if the sputum is induced or not, because an induced sputum generally is “more watery” and appears to be just saliva. Some private laboratories may throw out the specimen and report it as an “inadequate specimen.”
4. Make sure the specimen and laboratory requisition are packaged into appropriate shipping containers, per laboratory instructions.

Refer to the “Specimen Collection and Shipment Supplies” topic in the Supplies, Materials, and Services section, and see the “Specimen Shipment topic,” which follows.

5. If possible, send the specimen on the day it is collected. If this is not possible, refrigerate the specimen until it is sent on the next day.

6. Do not keep specimens to send all three on the same day.

7. Use the most rapid transport to the laboratory: yourself, courier, overnight carrier, or US mail.

Make every effort to submit specimens to the laboratory within 24 hours of collection. Normal flora can overgrow any mycobacteria in the specimen and make it unusable. If specimens cannot be submitted within 24 hours, keep in mind that most laboratories will not run a specimen over five days old. Know how long it takes the specimen to get to the laboratory from the time it leaves your hands, and submit specimens accordingly.

How to Direct a Patient to Perform Spontaneous Sputum Collection at Home

If a patient will be collecting sputum specimens at home, provide the following guidance.

1. Put a mark at the 5 ml level on the sputum tubes (if not already marked) to show the patient the minimum amount of sputum needed. (Most laboratories consider 5 to 10 ml an adequate amount.)

2. Review with the patient how to collect sputum.

3. Make arrangements for a healthcare worker to pick up the specimen or for the patient, a family member, or a friend to drop off the specimen.

Induced Sputum Collection at a Healthcare Facility

If the patient cannot produce sputum spontaneously, then make arrangements for an induced sputum to be collected at a facility. Facilities where sputum can be collected include the respiratory therapy department of a local hospital, TB clinic, or laboratory. Facilities should have appropriate respiratory protection, environmental controls, and policies and procedures.
How to Collect Gastric Aspirates

The following are basic guidelines for collecting gastric aspirates:

- Collect the specimen after the patient has fasted for 8 to 10 hours and, preferably, while the patient is still in bed.
- Collect a specimen daily for three days.

For additional information on how to collect a gastric aspirate and prepare the specimen for transport, see the guide and Francis J. Curry National Tuberculosis Center’s online video *Pediatric TB: A Guide to the Gastric Aspirate (GA) Procedure* at [http://www.nationaltbcenter.edu/products/product_details.cfm?productID=ONL-06](http://www.nationaltbcenter.edu/products/product_details.cfm?productID=ONL-06).

Bronchoscopy or Collection of Extrapulmonary Specimens

If TB staff are consulting with physicians before the specimens are collected, the physician should be reminded to send part of the specimen (not in formalin) to the microbiology laboratory for acid-fast bacilli (AFB) smear and culture, in addition to any other tests or pathology examinations the physician plans to obtain. In addition, a post-bronchoscopy sputum specimen should be sent for AFB smear and culture.

- **Bronchoscopy**: Refer the patient to a local specialist.
- **Extrapulmonary specimens**: These specimens will be collected by the physician performing the diagnostic work-up.
Specimen Shipment

There are three main categories of transportation methods: medical couriers, ground transportation, and air transportation. Category B Infectious Substances (raw diagnostic specimens, such as sputum, blood, or tissue) can be mailed through the US Postal Service (USPS), shipped by private carrier (e.g., Federal Express, Airborne Express, etc.), or transported by a medical courier. Pure mycobacterial cultures (or culture isolates suspected of being mycobacteria) are Category A Infectious Substances and can be transported only by a medical courier or shipped by private carrier as dangerous goods. Category A Infectious Substances cannot be mailed through the US Postal Service. Each category requires different packaging requirements to provide increased levels of protection against leaks and contamination.

Shipment of dangerous goods by USPS is regulated by the US Department of Transportation. Specific shipping instructions from the Centers for Disease Control and Prevention (CDC) can be found in the publication by the US Department of Health and Human Services (DHHS) Public Health Mycobacteriology: A Guide for the Level III Laboratory. Packaging and shipment of specimens by USPS should meet the following regulations:

- The Department of Labor, Occupational Safety and Health Administration (OSHA): 29 CFR 1910.1030

For shipments by private carriers, follow International Air Transportation Association (IATA) instructions. *Mycobacterium tuberculosis* pure cultures are defined as infectious substances/etiologic agents when shipped by private carrier and must be shipped in packaging approved by the United Nations (UN), according to IATA Packing Instruction 602. Diagnostic specimens are defined as human or animal specimens, including excreta, secreta, blood and its components, tissue, tissue fluids, and cultures of nontuberculous mycobacteria being transported for diagnostic or investigational purposes. Diagnostic specimens must be packaged according to IATA Packing Instruction 650.

The Montana Public Health Laboratory (MTPHL) has a contract with a medical courier to pick up specimens at various locations and deliver them to the MTPHL each weekday. Routes cover many of the major cities in Montana, and some locations serve as a central collection point for other facilities in that city.
For more information, contact Denise Higgins or Susanne Zanto, laboratory managers, at the Montana Public Health Laboratory at 800-821-7284.

Refer to the shipping regulations that are listed under “Resources and References” at the end of this section. Personnel who handle, package, and ship infectious materials must be trained in these procedures.

For packaging and shipping recommendations and training information, call Denise Higgins, laboratory manager, at the Montana Public Health Laboratory, at 800-821-7284 ext 3040 or directly at 406-444-3040.

To obtain specimen collection and transport supplies, see the topic on “Specimen Collection and Shipment Supplies” in the Supplies, Materials, and Services section.
