

Data source: Diabetes Prevention Program, Montana, 2008-2015. 6,584 participant attended ≥ 1 session and 2,252 (34%) participants had recorded risk score. *Risk score is based on the CDC's Prediabetes Screening Test. Adults aged ≥ 18 years with additional risk factors are eligible for the DPP.

- Among DPP enrollees with recorded prediabetes risk score, only 10% (220) of participants had low risk score (3-8).
- DPP participants with a low risk were more frequently Millennials and Generation X than Baby Boomers and the Silent and Greatest generations. These data suggest that high risk scores for prediabetes are more often associated with older age.
- Those who scored between 3 and 8 on the prediabetes screening test should keep their risk low by being active, not using tobacco, and eating low-fat meals with fruits, vegetables, and whole-grain foods.
- Those with score ≥ 9 are at a high risk for having prediabetes and should see their health care provider soon.
